

Step 14 - End-to-End Review + Polish

Phase E · Diagram · README · Walkthrough Script · ~20 min

Goal: Make the repo interview-ready: architecture diagram, README final pass, screenshot audit, and a 3-minute repo walkthrough script. Artifact: the polished repo itself.

LAB 1 — Architecture Diagram

Add this to the README (ASCII travels everywhere; a draw.io PNG in architecture/ is a bonus):

```
SOURCES          INGESTION          LAKEHOUSE (Databricks)          SERVING
fact_transactions --> ADF Copy (param: --> BRONZE raw Delta + audit -->
dim_customer      business_date,      SILVER PII-masked +
dim_account        7PM ET trigger,      quality report
dim_branch         retry + alerts)      GOLD business tables      Customer 360
                                      (Delta: time travel,      FINTRAC LCTR
                                      MERGE, SCD2)      fraud_alerts
```

LAB 2 — README Final Structure

Section	Content check
Title + one-liner	What it is, Canadian banking framing
Stack	Databricks serverless, Unity Catalog volumes, Delta, ADF, PySpark
Compliance focus	PIPEDA masking, FINTRAC LCTR/structuring, OSFI retention/lineage
Architecture	The diagram above
Repo map	Folder table - every folder listed actually has content
Highlights	5 bullets: SCD2, idempotent MERGE, backfill-proven ADF, fraud rules, quality reports
Honesty note	'Personal lab on free tiers; patterns mirror production banking practice'

LAB 3 — Screenshot Audit

Confirm these exist (capture any missing): Databricks workspace tree; customer_360 output; SCD2 two-row proof; quality report cell; ADF green debug run; two business_date folders (backfill proof); trigger at 19:00 Eastern; Monitor run; alert rule; fraud_alerts summary.

LAB 4 — The 3-Minute Walkthrough Script

Practice clicking through the repo while narrating: README diagram (30s: the flow), databricks/05 notebook (60s: the layers + masking + quality report), 06_delta_lab (30s: SCD2 + time travel), adf/ (40s: parameterized pipeline + backfill screenshots), 07_fraud (20s: the rules). End on: 'Everything here runs; every screenshot is from my own environment.' Interviewers remember candidates who can DRIVE their portfolio.

CHECKPOINT

Pass criteria: a stranger could understand the project from the README alone in two minutes; every folder has real content; you can deliver the walkthrough without reading.
