

Step 15 - Resume + 90-Second Pitch

Phase E · Bullets · Pitch · STAR Stories · ~20 min

Goal: Convert the work into interview assets: 4 resume bullets, the 90-second pitch, and 2 STAR stories. Artifact: interview-prep/pitch.md

LAB 1 — Resume Bullets (adapt truthfully to your situation)

- Built an end-to-end Canadian banking data platform: ADF (parameterized, scheduled, alerting) ingesting to ADLS, Databricks Medallion lakehouse (Bronze/Silver/Gold) processing 10K+ daily transactions with PIPEDA-compliant PII masking (SIN, account, FSA-level postal codes)
- Implemented Delta Lake patterns: SCD Type 2 customer dimension via MERGE, idempotent exactly-once transaction loads, time travel supporting OSFI-style as-of audit queries
- Developed rule-based AML detection (FINTRAC structuring via 7-day window functions, velocity anomalies, LCTR extraction) landing in a governed Gold alerts layer
- Designed operational controls: per-run data quality reports, reject flows with reason codes, GL reconciliation pattern with halt-on-failure

If this is a personal lab, label the section 'Independent Project - MapleBank Data Platform (GitHub link)'. Never present lab work as employment - interviewers check, and honesty + working code beats inflation every time.

LAB 2 — The 90-Second Pitch (memorize the shape, not the words)

"I built MapleBank, an end-to-end data platform modeled on Canadian retail banking. Azure Data Factory orchestrates ingestion - the pipeline is parameterized by business date with backfill proven, scheduled 7 PM Eastern with retries and failure alerting. Data lands in a bronze layer and Databricks takes over: Silver deduplicates, validates, and applies PIPEDA masking - SINs to last-three, postal codes to FSA, raw PII dropped entirely - with a quality report every run. Gold serves a Customer 360, branch summaries, and FINTRAC outputs: LCTR extracts plus a rule-based alerts table detecting structuring and velocity patterns through window functions. The dimension layer is SCD Type 2 via Delta MERGE, loads are idempotent, and time travel answers as-of audit questions. Everything is public on my GitHub - I can walk you through any notebook."

Delivery notes: 150-160 words = 75-90 seconds spoken. Practice aloud 5 times. End by offering the walkthrough - it invites the next question on YOUR turf.

LAB 3 — Two STAR Stories

	Story A: Schema surprise	Story B: The 3 AM rerun design
Situation	Upstream added a column mid-project	Pipelines hardcoding utcnow() cannot backfill
Task	Protect the Silver contract	Make every load rerunnable for any date
Action	Delta schema enforcement rejected the write loudly; reviewed, then applied mergeSchema as a deliberate change	Parameterized business_date (empty=today, value=backfill); proved it by re-running for a past date; paired with idempotent MERGE so reruns never duplicate
Result	No silent corruption; documented evolution policy	Demonstrated backfill with two dated folders; rerun-safe by design

Write both in your own words in pitch.md - your phrasing, your recall.

CHECKPOINT

Pass criteria: pitch delivered aloud under 100 seconds without reading; bullets truthful and quantified; pitch.md committed to interview-prep/.

MapleBank Practical Track · Step 15 of 16 · Canadian Banking Context (OSFI · FINTRAC · PIPEDA)
